A California farmer named Culp, in 1872 secured a patent for a new process of euring tobacco, which appears very simple, but is said to effect a great improvament in the quality of the plant. The process consists merely in piling the tobacco in its green state, when first eut, allowing it to remain in this shape until it attains the heat of one hundred degrees Fahrenheit, the width of the piles being the length of the plants. This causes a profuse sweating, when the plants are laid horizontally upon racks instead of being hing up as is usually done, whereupon the leaves maturally fall sparts.

In a paper on the sanitary aspects of primary education, read recently by Dr. R. J. Sullivan, before the New York Academy of Medicine, an mportant suggestion occurs in reference to the earliest age at which a pupil should be admitted in our schools. He contends that seven years is a minimum age, not because mental exertion would be injurious to healthy intellectual growth, but because school life under its present hygienic surroundings is very unfavorable to physical development. In other words it is to be under-stood that although a pupil is capa-

ple of reasonable understanding and
